T – Web Development Seminar

T-WEB-xOO

Day 05

HTML/CSS

Day 05

repository name: web_seminar_day05_$ACADEMICYEAR
repository rights: ramassage-tek
language: HTML/CSS

- Your repository must contain the totality of your source files, but no useless files (binary, temp files, obj files,...).

- All the bonus files (including a potential specific Makefile) should be in a directory named *bonus*.

The design of a website is a static file (usually a PSD file) created by a web designer.
The mock-up is the resulting picture of this design. It thus represents what the final website should look like.
The person in charge of integration (that is to say you, in the present case) then buids the raw HTML file from this mock-up.

That's roughly all you need to know.

Make an HTML page from the mock-ups given with the subject.

YOU handle the great responsibility of deciding which of Batman or Unicorns is the best.

Use the most relevant HTML tags to be coherent with the content.

You can use Materialize and you can overload it in your own CSS files.
